## WORK EXPERIENCE

### SOFTWARE DEVELOPER

Hearo | Nov 2019 - Present

At Hearo we build applications that allow our users to provide remote care to people with developmental disabilities. I've played a significant role in:

- Leading development on the company's main mobile application. This included VOIP, background location tracking, and push notification features.
- Leading initial development of and adding new features to the company's kiosk style desktop application. This also included VOIP features.
- Adding additional features and fixing bugs to the company's web dashboard and REST API.

### LEAD SOFTWARE DEVELOPER

EmergencMe | Jun 2019 – Nov 2019

When I joined EmergencMe, the goal was for the company to begin moving its development away from overseas contract developers to a local team. The company shut down at the end of 2019 before that goal could be fully realized. Before the shut down I was responsible for:

- Being the point of contact between the contract developers and the rest of our team. This included working with the overseas team to work out how to best implement requested features.
- Working with the sales team in doing product demos at in person meetings and trade shows.
- Building a scraper to populate our system with data from another systems email notifications as well as to pull in data from the National Weather Service API. This was built with .NET Core and AWS Lambda

### SOFTWARE DEVELOPER

Mostly Serious | Jan 2018 – Jun 2019

During my time with Mostly Serious I was one of the 3 engineers at the company. My duties normally involved maintenance, bug fixes, and additional features for ongoing projects. as well as leading development on some of the newer projects.

Some of the projects I lead development on included:

- essets.com
- paragon360.com
- ozarkstransportation.org

I also played a major role in some large internal projects including

- Migrating many existing projects from shared servers to a new cloud infrastructure on AWS using EC2 autoscaling. This also included setting up CI/CD using Bitbucket pipelines and AWS Codedeploy.
- Working with the engineering team to establish consistent code styles as well as upgrading our internal tooling to allow us to take advantage of modern web features.
